Fast 100 Award

Fast Tech 50 Award

Emerging E-10

Partial List of Clients:

We have been a professional, reliable partner for various industries and for companies such as:

- Maraton Oil
- British Petroleum
- American First National Bank
- Technip
- UT Health Science Center - Houston
- UT Physicians

Testimonials

"...We had a critical project deadline that had to be met...Mike quickly came up to speed on the environment and was extremely dedicated and professional throughout the project. It required...extra hours...and SunNet management committed the time needed to get it done, and to get it done right...We look for partners who share the same values. The commitment, professionalism and quality of work were excellent and we will not hesitate to use SunNet again."

President eXcelence in IS Solutions

"SunNet was able to complete the design and implementation of the website in less time than we agreed to and under budget! That is truly amazing and is much appreciated."

Sr. Crude Quality Coordinator, Shell Pipeline

"What an amazing team you have! We are so impressed with the professionalism and attention to every detail your team has paid to our project."

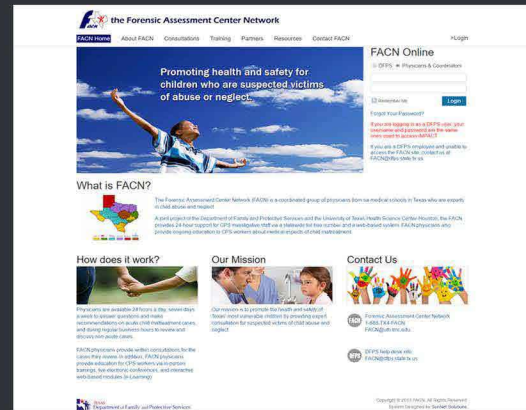

BP, Houston, Texas

Turn your idea into Real Software System

In 2008, SunNet established AGILE Process-Development Approach (APDA), our methodology integrating both waterfall and agile software development methodologies, along with other project management skills. It is continuously updated to ensure projects are successfully delivered. Projects that have been developed with APDA have been successfully completed for clients such as BP, UT Health Science Center-Houston and many more.

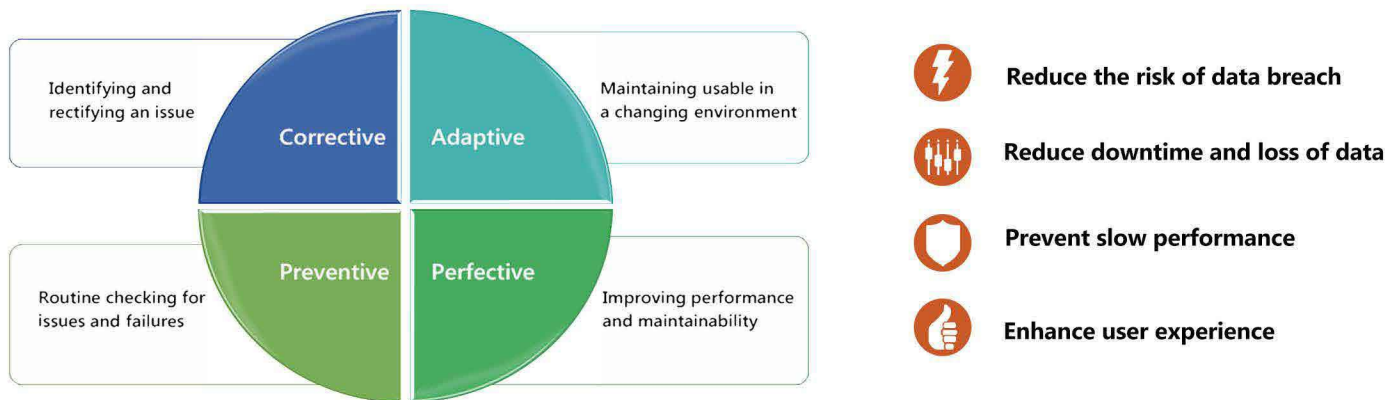

Delivering the right software on time and on budget

1. Working software delivered frequently-within 2 months
2. Reduce development costs by at least 20%
3. A quality product through regular verification
4. Increased project success rate- up to 100%
5. Rapidly support operations

Custom Software Maintenance

As a business continues to grow, their need for improved software must be implemented. In many cases, the software is outdated and modifications must take place to meet the new challenges of the business. That said, completely replacing software is not always the answer and can be extremely inconvenient. Modifying your existing application can be a better alternative in many cases.

Web Application Performance

As your business develops, your web based application will eventually run into issues such as data reaching storage size limitation, as well as poor application performance caused by the increasing amount of concurrent users in the application. Today's technology evolves so fast, it is almost impossible to measure how long your application can perform at your desired level. Let us help you with the following tasks. With a bit of work, you will be on the right path to the top in no time:

- Investigate poor application performance
- Code refactoring
- Application Cache
- Database optimization
- Change workflow implemented in the software
- Consultation on hosting solutions
- Consultation on server resource upgrades
- Consultation on server farm

Legacy Software Modernization

Obsolete or inefficient software greatly increases your organization's security risk and can severely damage an organization's reputation.

- **Improved Regulation Compliance**- Automate regulation processes to facilitate coherent policies, standard procedures, financial reporting, change records, and any other required reports
- **Improved Organization Agility**- Quickly adapt and respond to ongoing or changing business demands
- **Reduced Operational Costs**- Lessen ongoing maintenance support fees on legacy applications that cannot fully support your organization and free up your budget for IT innovation
- **Reduced Reliance on Legacy Skill Sets**- With more and more IT personnel moving towards new languages, the availability of legacy SMEs is diminishing rapidly
- **Reduced Security Breaches**- With incorporated security measures in place, you ensure a safe and secure system

Web Application Security

The majority of information security issues are due to insecure code. To address this, a standard security control process on all the applications developed is followed. Listed below are the 7 software security services incorporated into every application we build.

- Application Security Requirements
- Application Security Architecture
- Coding Security Standard
- Security Scan (including OWAPS Top 10)
- Security Test
- Standard Security Checking List
- Continue Security Education

*Modernization and system security is a complex and critical process.
Ensure you've got the right team behind you.*
